DANGER, WARNING, CAUTION, and NOTE Statements

DANGER, WARNING, CAUTION, and Note statements are used throughout this manual to emphasize important and critical information. You must read these statements to help ensure safety and to prevent product damage. The statements are defined below.

DANGER indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury. This signal word is to be limited to the most extreme situations.

WARNING indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury. It may also be used to alert against unsafe practices.

NOTE: A NOTE statement is used to notify people of installation, operation, programming, or maintenance information that is important, but not hazard-related.
WARNING

• This manual instructs you how to use PulseStar•609. If you disregard the instructions, information, and/or warranty in the manual, you could be assuming responsibility for damages, costs, or injury incurred by such disregard.

• Do not touch any circuit components on the circuit board while the main AC power is on.

• Do not make any address code or frequency channel changes in the transmitter or receiver without first contacting Electromotive Systems.

Welcome!

Welcome to the PulseStar•609 radio remote crane control system. Electromotive Systems has set a whole new standard in radio-remote performance, dependability, and value with this unique new line of modular transmitters and receivers. Without a doubt, PulseStar•609 is the ultimate solution for having precise, untethered, and safe control of overhead loads.

Using state-of-the-art synthesizer technology and the best circuit board manufacturing designs available, Electromotive Systems has eliminated many of the unreliable and expendable electromechanical components found in traditional radio remote systems.

The PulseStar•609 system consists of a receiver and a transmitter. The system uses PulseStar’s synthesizer technology and operates over the 400-470 MHz band. PulseStar•609 is FCC approved with no site license required.

PulseStar’s unique transmitter and receiver design provide a sophisticated, yet easy-to-understand, efficient, and safe radio remote control. PulseStar’s modular design has the following advantages:

- Flexible design allows easy mixing and matching.
- On-board diagnostic allow easy troubleshooting.
- Standardized spare parts; kits available.
- Simple design.
PulseStar PBT-4-609 System

The PulseStar PBT-4-609 system consists of a GA609 receiver and PBT-4 transmitter kit. The PBT-4-609 system is normally used for remote control of one (1) four motion, single-speed or two speed crane.

GA609 Receiver

The GA609 receiver is provided with:

- Twelve motion relays for discreet output to adjustable frequency drives and/or contactors.
- Start relay.
- Horn relay.
- **Active E-STOP** relay.
- **OPTION** relay.
- Two **SELECTOR** relays.
- Self-diagnostics to ensure trouble-free operation.
- 16-bit address security code (over 65,000 possibilities).
- Miniflex antenna with 330 foot range.
- IP65 weatherproof enclosure.

PBT-4 Transmitter Kit

The PBT-4 transmitter kit is provided with:

- PBT-4 transmitter:
  - Eight two detent motion push-buttons.
  - **START/HORN** push-button.
  - **OPTION** push-button.
  - **Active E-STOP** for immediate stopping action.
  - **Sleep Mode** to increase battery life and enhance safety.
  - Removable key switch for added security.
  - 16-bit address security code (over 65,000 possibilities).
  - Internal antenna with 330 foot range.
  - IP65 enclosure.
  - Carrying belt.
- Battery charger.
- Two rechargeable batteries.
PulseStar PBT-5A-609 System

The PulseStar PBT-5A-609 system consists of a GA609 receiver and PBT-5A transmitter kit. The PBT-5A-609 system is normally used for remote control of a single-speed or two speed overhead crane with individual/combined control of trolley/hoists. The PBT-5A-609 system is also used on three motion, single or two speed cranes with a magnet or vacuum lifter system.

GA609 Receiver

The GA609 receiver is provided with:

• Twelve motion relays for discreet output to adjustable frequency drives and/or contactors.
• Start relay.
• Horn relay.
• Active E-STOP relay.
• OPTION relay.
• Two SELECTOR relays.
• Self-diagnostics to ensure trouble-free operation.
• 16-bit address security code (over 65,000 possibilities).
• Miniflex antenna with 330 foot range.
• IP65 weatherproof enclosure.

PBT-5A Transmitter Kit

The PBT-5A transmitter kit is provided with:

• PBT-5A transmitter:
  • Eight two detent motion push-buttons.
  • START/HORN push-button.
  • OPTION push-button.
  • Two SELECTOR push-buttons.
  • Active E-STOP for immediate stopping action.
  • Removable key switch for added security.
  • 16-bit address security code (over 65,000 possibilities).
  • Internal antenna with 330 foot range.
  • IP65 enclosure.
  • Carrying belt.
• Battery charger.
• Two rechargeable batteries.
PulseStar PBT-5A-609/6-2 System

The PulseStar PBT-5A-609/6-2 system consists of two (2) GA609 receivers and one (1) PBT-5A transmitter kit. The PBT-5A-609/6-2 system is normally used for remote control of two (2) single or two speed overhead cranes on a single runway.

GA609 Receiver

The GA609 receiver is provided with:
- Twelve motion relays for discreet output to adjustable frequency drives and/or contactors.
- Start relay.
- Horn relay.
- Active E-STOP relay.
- OPTION relay.
- Two SELECTOR relays.
- Self-diagnostics to ensure trouble-free operation.
- 16-bit address security code (over 65,000 possibilities).
- Miniflex antenna with 330 foot range.
- IP65 weatherproof enclosure.

PBT-5A Transmitter Kit

The PBT-5A transmitter kit is provided with:
- PBT-5A transmitter:
  - Eight two detent motion push-buttons.
  - START/HORN push-button.
  - OPTION push-button.
  - Two SELECTOR push-buttons.
  - Active E-STOP for immediate stopping action.
- Removable key switch for added security.
- 16-bit address security code (over 65,000 possibilities).
- Internal antenna with 330 foot range.
- IP65 enclosure.
- Carrying belt.
- Battery charger.
- Two rechargeable batteries.
PulseStar NVT-J33D-609 System

The PulseStar NVT-J33D-609 system consists of a GA609 receiver and NVT-J33D transmitter kit. The NVT-J33D system is normally used for remote control of a three speed overhead crane, or a three speed overhead bridge crane with individual/combined control of two hoists or two trolley/hoists. The NVT-J33D-609 system is also used on three motion, single or two speed cranes with a magnet or vacuum lifter system.

GA609 Receiver

The GA609 receiver is provided with:

- Twelve motion relays for discreet output to adjustable frequency drives and/or contactors.
- Start relay.
- Horn relay.
- Active E-STOP relay.
- OPTION relay.
- Two SELECTOR relays.
- Self-diagnostics to ensure trouble-free operation.
- 16-bit address security code (over 65,000 possibilities).
- Miniflex antenna with 330 foot range.
- IP65 weatherproof enclosure.

NVT-J33D Transmitter Kit

The NVT-J33D transmitter kit is provided with:

- NVT-J33D transmitter:
  - Dual axis three detent joystick.
  - Single axis three detent joystick.
  - START/HORN push-button.
  - OPTION toggle switch.
  - SELECTOR toggle switch.
  - Active E-STOP for immediate stopping action.
  - Removable key switch for added security.
  - 16-bit address security code (over 65,000 possibilities).
  - Internal antenna with 330 foot range.
  - IP65 enclosure.
  - Carrying belt.
- Battery charger.
- Two rechargeable batteries.
PulseStar NVT-J33D-609/6-2 System

The PulseStar NVT-J33D-609/6-2 system consists of two (2) GA609 receivers and one (1) NVT-J33D transmitter kit. The NVT-J33D-609/6-2 system is normally used for remote control of two (2) three speed overhead cranes on a single runway.

GA609 Receiver

The GA609 receiver is provided with:

- Twelve motion relays for discreet output to adjustable frequency drives and/or contactors.
- Start relay.
- Horn relay.
- Active E-STOP relay.
- OPTION relay.
- Two SELECTOR relays.
- Self-diagnostics to ensure trouble-free operation.
- 16-bit address security code (over 65,000 possibilities).
- Miniflex antenna with 330 foot range.
- IP65 weatherproof enclosure.

NVT-J33D Transmitter Kit

The NVT-J33D transmitter kit is provided with:

- NVT-J33D transmitter:
  - Dual axis three detent joystick.
  - Single axis three detent joystick.
  - START/HORN push-button.
  - OPTION toggle switch.
  - SELECTOR toggle switch.
  - Active E-STOP for immediate stopping action.
- Removable key switch for added security.
- 16-bit address security code (over 65,000 possibilities).
- Internal antenna with 330 foot range.
- IP65 enclosure.
- Carrying belt.
- Battery charger.
- Two rechargeable batteries.
How to Use This Manual

PulseStar®609 Instruction Manual has a comprehensive introduction chapter that you should read before installing, wiring, or operating the system. It introduces some of the many features of the PulseStar®609 system.

Chapter 2 covers installing and wiring the receiver, as well as start-up and test procedures to make sure the system is working properly before you begin regular operation.

Chapter 3 covers each type of transmitter individually. Refer to this chapter to identify the transmitter you have. This chapter also covers how to set the address code and frequency channel, start up, and how to operate the transmitter.

Chapter 4 gives you a basic troubleshooting guide, plus a checklist of things to look for before calling Electromotive Systems for service. In most cases, problems are minor and easy to solve.

Important System Information

Before working with the PulseStar®609 system, read and understand the following important system information.

- Resistor-Capacitor (RC) surge suppressors must be used when the PulseStar®609 receiver is controlling magnetic contactors.
- When not in use, the transmitter should be turned off and stored in a safe place to prevent unauthorized users from operating it.
- If the crane fails to respond properly, stop operation immediately, turn off the transmitter, and report the condition immediately to an appropriate technician or supervisor.
- Wire the receiver circuit board to the crane’s ground.
- When using a standard external antenna mount it on a conductive metal surface with the same ground as the receiver circuit board. Remove any burrs from the antenna mounting hole and scrape away any paint which may prohibit the antenna base from making a good ground contact with the surface. Make sure that the antenna is not surrounded by metal or other conductive materials. Failure to properly install the antenna will result in intermittent operation.
- When using a gain flex external antenna make sure that your mounting location is at least 2 meters (6 feet) from any metallic or conductive objects. These objects may interfere with the antenna and cause intermittent operation.
- Before working on the transmitter, turn off the key switch and remove the battery.
- When taking a break or changing the battery, turn the transmitter off with the key switch.
- Always have a battery in the battery charger to ensure a fully charged battery is available.
- Perform initial setup or service work only if you have been authorized to do so. Use only Electromotive Systems spare parts.
- If your facility has more than one PulseStar remote radio control system, and the systems operate within 200 feet of one another, the frequency channels for each system must be at least two channels apart. If the systems operate within 50 feet of one another, the frequency channel for each system must be at least three channels apart.
Chapter 1

PulseStar•609
System Overview
PulseStar•609 System Overview

Introduction

This chapter introduces the basic conceptual information that you should know before installing, wiring, and operating the PulseStar•609 system.

Theory of Operation

The PulseStar•609 system consists of a transmitter kit and a receiver. The transmitter, using PulseStar’s synthesizer technology, electronically generates a carrier frequency over which it and the receiver communicate. PulseStar•609 transmitters and receivers operate over the 400-470 Mhz frequency range (70 cm. band). To guarantee safety when the crane is being operated in conjunction with other radio controls, the receiver and transmitter are configured with the same address code. This way, the receiver only seeks out and accepts commands from the transmitter with the same address code.

NOTE: The PulseStar•609 receiver and transmitter already has the address code set before they are shipped. Never change the address code in the receiver. The only time you should need to change the address code inside the transmitter is when you are setting up a spare or replacement transmitter. If you have any questions about address codes and how they are used, contact Electromotive Systems.

Active Emergency Stop (E-STOP) Function

One of the most important features of the PulseStar•609 is Active E-STOP. The transmitter continuously sends the Active E-STOP status signal, followed by the desired crane function. This constant communication between the transmitter and the receiver confirm that the ongoing operations are safe. If the Active E-STOP push-button is pressed on the transmitter, the Active E-STOP relay module in the receiver opens, and crane motion then ceases. The receiver is then in Safe Mode.

To restart the system after activating Active E-STOP via the Active E-STOP push-button, pull out the Active E-STOP push-button and press the START/HORN push-button.

NOTE: There are other situations in which the system automatically goes into Active E-STOP without the operator pressing the Active E-STOP push-button on the transmitter. These are explained in later sections of the manual.

Active E-STOP responds faster than any other PulseStar function. When Active E-STOP occurs, the system ignores any other signal it receives. Active E-STOP is the only signal that is recognized until the problem is corrected.

Active E-STOP is fail-safe and self-monitoring in both the transmitter and receiver. When you apply power to the receiver, it performs a self-test to make sure the Active E-STOP circuitry is working properly. If the receiver detects an error in the Active E-STOP circuitry, the system automatically goes into Safe Mode.

When you first turn on the transmitter, it also performs a self-test to make sure CPU circuitry is working properly. If it detects an error, the transmitter will not begin transmitting.
Sleep and Time-Out Modes

Transmitter Sleep Mode

To prevent accidental operation, PulseStar•609 transmitters have a built-in safety feature called Sleep Mode. If a transmitter is not used for 10 minutes, it turns itself off. While the transmitter is in Sleep Mode, the push-buttons, joysticks, or switches will not operate. To restart the transmitter cycle power (turn the key off and back on), and press the START/HORN push-button.

**NOTE:** If the transmitter has a selector switch or latching push-button, sleep mode will not occur because the selector switch or push-button is constantly sending a signal to the receiver.

Receiver Safe Mode

Another PulseStar•609 safety feature is the Safe Mode. The receiver will go into Safe Mode if any of the following should occur.

- The transmitter goes into Sleep Mode.
- Interference caused by other transmitters or other radio-controlled products in the area.
- The transmitter is taken out of its operating range (330 feet).
- The Active E-STOP push-button is activated.
- There is a failure with the Active E-STOP circuitry.

When the receiver loses the transmitter carrier frequency signal, the Time Out Waiting Period process begins. The Time Out Waiting Period is factory set at 450msec, however it can be extended to 2 seconds. If the receiver does not regain the transmitter carrier frequency signal before the Time Out Waiting Period expires, the receiver immediately goes into Safe Mode. When in Safe Mode the receiver shuts off power to the output modules, and drops out the mainline contactor by opening the Active E-STOP relay module.

To restart the system, make sure the transmitter carrier frequency signal is being picked up by the receiver. Then press the START/HORN push-button on the transmitter.
Chapter 2

The PulseStar•609 Receiver
This page is intentionally left blank.
Overview

This chapter tells you how to install and wire the PulseStar•609 receiver. It also contains start-up and test procedures so you can ensure that the transmitter and receiver are working properly before you actually use them to control the overhead crane.

This chapter covers the following information.

• Receiver Components
• Installing the PulseStar•609 Receiver
• Startup and Test Procedures

WARNING

Only authorized personnel are permitted to perform the initial installation, setup or service work. Use only Electromotive Systems spare parts.
Receiver Components

The PulseStar•609 receiver receives commands from the remote transmitter, and interfaces with the crane controls to move the crane. See Figure 2.1: PulseStar•609 Receiver Layout for component layout and identification.

1. Enclosure
2. Antenna Base
3. Ground Terminal Block (PE)
4. Line Terminal Block w/Fuse
5. Power Pack (50/110/240vac)
6. Miniflex Antenna

14. Cover Plate Hole Plug PG-21
15. SNE Active E-STOP Module
16. Enclosure Cover
Installing the PulseStar•609 Receiver

WARNING

- Only authorized personnel are permitted to perform the initial setup or service work. Use only Electromotive Systems parts.
- Do NOT touch any circuit components on the circuit board while the main AC power is on.
- Do NOT change the address code settings in the receiver.
- Do NOT run control wires with power wires.
- Surge Suppressors must be used with all magnetic contactors that are controlled by the PulseStar•609 system.

Assessing the Receiver Enclosure Environment

When you choose a location for the receiver enclosure, consider the following guidelines.

1. The Receiver can be operated on the following power supplies:
   - 50/110/240V (+/- 20%), AC, Single Phase.
2. Ensure that the receiver enclosure will be protected or isolated from:
   - Ambient temperatures outside the range of -18°F to 158°F (-25°C to +70°C) (Consult Electromotive Systems if you must exceed this temperature range).
   - Corrosive gases or liquids.
3. As much as possible, ensure that the receiver is not surrounded by metal or other conductive materials that could prevent the internal antenna from receiving the transmitter signal. If you are using an external antenna, ensure that it is not surrounded by metal or other conductive materials.

Serial Nameplate

Before you prepare to mount the receiver, locate the serial nameplate. The receiver serial nameplate is typically located on the right hand side of the enclosure. The serial nameplate contains the Electromotive Systems job number, the address code used by the system, and the frequency channel used by the system. The Electromotive Systems job number is important if you ever need to call Electromotive Systems for service. When you mount the receiver, ensure that the serial nameplate is visible so that you can easily read the Electromotive Systems job number.

![Figure 2.2: Serial Nameplate](image)

PulseStar

<td>5</td>
</tr>
</tbody>
</table>
Mounting the PulseStar•609 Receiver

Refer to Figure 2.3: PulseStar•609 Receiver Dimensions for mounting the PulseStar•609 receiver.

Figure 2.3: PulseStar•609 Receiver Dimensions

1. Determine the position of the receiver enclosure. Position the enclosure so that the cover plate is on the bottom or on the side.

2. Loosen the screws holding the cover of the enclosure.

3. Refer to Figure 2.4: PulseStar•609 Mounting Hole Dimensions. Drill holes into the mounting surface. The depth of the hole depends on the type of screw you are using to mount the receiver enclosure.

Figure 2.4: PulseStar•609 Mounting Hole Dimensions
4. Insert the screws through each of the mounting holes, and then tighten the mounting screws to
   the mounting surface.
5. Determine the sizes and connection locations for the components that need to be wired.
6. Remove the hole plug(s) you are going to use for control or power wires.
7. Lay out the wire runs. At a minimum, use #18-AWG wire for control wiring.
Wiring the PulseStar•609 Receiver

The following wiring diagrams represent different PulseStar•609 applications. Select the wiring diagram which matches your application.

**PBT-4-609 and PBT-5A-609**

Refer to Figure 2.5: PulseStar PBT-5A-609 Wiring Diagram to wire the PulseStar•609 receiver to the crane controls. The PBT-4-609 system is wired the same as the PBT-5A-609 system, except it does not have SELECTOR capability.

![Figure 2.5: PulseStar PBT-5A-609 Wiring Diagram](image-url)
**PBT-4-609 and PBT-5A-609 with Pendant**

Refer to Figure 2.6: PulseStar PBT-5A-609 Wiring Diagram with Pendant to wire the PulseStar•609 receiver to the crane controls when a back-up pendant is used. The PBT-4-609 system is wired the same way as the PBT-5A-609 system, except it does not have SELECTOR capability.

**NOTE:** The radio/pendant transfer switch shown does not provide total isolation between the radio control system and the pendant station. It is recommended that when the transfer switch is in “radio” mode that the pendant station be unplugged or placed in such a position that prevents simultaneous operation.
NVT-J33D-609

Refer to Figure 2.7: PulseStar NVT-J33D-609 Wiring Diagram to wire the PulseStar•609 receiver to the crane controls.

Figure 2.7: PulseStar NVT-J33D-609 Wiring Diagram
NVT-J33D-609 with Pendant

Refer to Figure 2.8: PulseStar NVT-J33D-609 Wiring Diagram with Pendant Back-up to wire the PulseStar•609 receiver to the crane controls when a back-up pendant is used.

**NOTE:** The radio/pendant transfer switch shown does not provide total isolation between the radio control system and the pendant station. It is recommended that when the transfer switch is in “radio” mode that the pendant station be unplugged or placed in such a position that prevents simultaneous operation.
1. Run the power and control wires through the plug holes in the bottom of the receiver enclosure.

**NOTE:** Ensure that the receiver signal wires and the high voltage power wires cross at 90° angles. Never combine high voltage power and control wires in the same cable run.

2. Connect the single-phase power wires to the power supply terminal block.

3. Connect the output wires using the appropriate wiring diagrams previously shown.

4. Connect the ground wire from the receiver to the crane’s ground.

5. Reinsert the cover of the receiver enclosure and tighten the screws.

6. Install Resistor-Capacitor (RC) type surge suppressors (not MOV type) across the coils of any contactors installed in the crane control circuit.

**NOTE:** Surge suppression is required on all magnetic contactors controlled by the receiver. Uncommanded crane motion and/or serious component damage may occur if surge suppressors are not used.
Connecting a Standard External Antenna

In some cases, such as when the receiver is inside a panel enclosure, you may need to connect an external antenna to the PulseStar•609 receiver instead of using the miniflex antenna. Mount the standard external antenna on a metal surface with the same ground as the receiver circuit board. Make sure that the antenna is not surrounded by metal or other conductive materials. For best reception, the antenna should be pointing upward.

**NOTE:** *Failure to properly install the antenna will result in intermittent operation.*

1. Drill a $\frac{9}{16}$ inch hole through the enclosure.

2. Insert the connector base through the hole so that the antenna side is on the outside, and the base is seated firmly against the enclosure surface. Remove any burrs from the antenna mounting hole and scrape away any paint which may prohibit the antenna base from making ground contact with the enclosure.

3. Assemble the antenna according to Figure 2.9: Standard External Antenna.

4. Screw the antenna pole onto the antenna base.

5. Remove the miniflex antenna mounted on the PulseStar•609 receiver by unscrewing it from the antenna base.

6. Connect the antenna cable connector to the antenna base on the PulseStar•609 receiver housing.

7. Bundle any excess antenna cable by looping the cable, then flatten the cable loop and tighten both ends of the flattened cable with tie wraps or equivalent.

**NOTE:** *Never run the antenna cable with power or control wiring. Doing so will result in intermittent operation.*
Connecting a Gain Flex Antenna

Some applications require the use of a gain flex antenna. The gain flex antenna can extend the operating range of the PulseStar•609 system up to 300 meters (1000 feet). It is also used with intrinsically safe applications, and applications where a standard antenna is too difficult to mount. Make sure that there are no metallic or other conductive materials within a 2 meters (6 feet) radius of the gain flex antenna. These objects will interfere with the reception of the gain flex antenna, and will result in intermittent crane operation. For best reception, the antenna should be pointing upward.

NOTE: Failure to properly install the antenna will result in intermittent operation.

Refer to Figure 2.10: Gain Flex Antenna when installing the gain flex antenna.

1. Affix the antenna base of the gain flex antenna to a mounting surface by using the two tie wraps included with the antenna kit. For best reception the antenna base should be mounted vertically with the antenna base pointing upward.

2. Screw the gain flex antenna pole onto the antenna base.

3. Remove the miniflex antenna mounted on the PulseStar•609 receiver by unscrewing it from the antenna base.

4. Connect the antenna cable connector to the antenna base on the PulseStar•609 receiver housing.

5. Bundle any excess antenna cable by looping the cable, then flatten the cable loop and tighten both ends of the flattened cable with tie wraps or equivalent.

NOTE: Never run the antenna cable with power or control wiring. Doing so will result in intermittent operation.
Startup and Test Procedures

### WARNING

- Only authorized personnel are permitted to perform testing or service work.
- Make sure the crane is clear of any obstructions, and there is no load on the hook.
- Serious injury or component damage can occur if the PulseStar•609 system is not properly installed and tested.

### Pre-operation Check List

Before you begin operating the PulseStar•609 system to control your overhead crane, confirm the following check list to ensure that your system is working safely and correctly.

- There is a fully-charged battery in the transmitter.
- The second battery is in the charger being charged at all times. Ensure that the battery charger is plugged into a power source that is not turned off at night with the crane.
- The Active E-STOP push-button on the transmitter is pushed in (activated).
- The joysticks are in the center position (NVT-J33D), the switches are in the center (off) position, and the push-buttons are not depressed (PBT-4, PBT-5A).
Testing the Receiver

As you perform the following startup test, place yourself in front of the PulseStar•609 receiver with the cover off so that you can clearly see each LED and connection. Refer to Figure 2.11: PulseStar•609 Receiver Test Layout for LED and module locations.

1. Turn on the power to the receiver. The CPU Standby LED should flash yellow to indicate that the microprocessor is functioning properly and X1 LED, X2 LED, and X3 LED on the Power Pack should turn on.

2. Insert the key into the key switch and turn to the ON position. A buzzer sounds to indicate the start of a diagnostic test. The diagnostic test checks for the following.
   - The software is functioning properly.
   - The joysticks (NVT) or are in the center (off) position or the motion push-buttons (PBT) are not pressed down.
3. After the diagnostic test the following should occur.
   • The Telegram LED should flash on the Decoder Module to indicate that the receiver is
detecting a valid signal from the transmitter.

4. Pull out the Active E-STOP push-button. The following should occur.
   • The X4 LED on the Power Pack should turn on.
   • The Decoder E-STOP LED on the Active E-STOP relay module should turn on.

5. Test the Active E-STOP function by pushing in the Active E-STOP push-button on the transmitter.
The following should occur.
   • The X4 LED on the Power Pack turns off.
   • The Decoder E-STOP LED on the Active E-STOP relay module turn off.

6. Pull the Active E-STOP push-button out and press the START/HORN push-button on the
transmitter. The start relay LED should turn on, and the start relay should close to activate the
mainline contactor, and the horn will sound (when supplied).

7. Activate the motion push-buttons (PBT) or joysticks (NVT) to test the crane functions. Confirm
that the crane moves appropriately and that the LEDs corresponding to the motion relays turn on.
These LED’s will be located directly above the discrete relay for digital signals.

8. Activate the OPTION push-button (PBT) or toggle switch (NVT) to test OPTION relay. Confirm
that the LED corresponding to the OPTION relay turns on.

9. Activate the SELECTOR push-buttons (PBT5A) or toggle switch (NVT) to test SELECTOR
relays. Confirm that the LED’s corresponding to the SELECTOR relays turns on.

10. Turn the key switch to OFF. The following should occur.
   • The X4 LED on the power pack turns off.
   • The Decoder E-STOP LED on the Active E-STOP relay module turn off.
   • The Telegram LED on the Decoder Module turn off.

11. If all transmitter and receiver functions work properly, the system is ready for use.

**NOTE:** If you experienced any problems during this test refer to Chapter 4 Troubleshooting
PulseStar•609 for help, or call Electromotive Systems.
Changing the Frequency Channel of the Receiver

Standard RF Module

The standard RF module is capable of receiving one of 16 discrete frequency channels. The frequency channel of the transmitter and receiver are set by Electromotive Systems prior to shipment. Should interferences occur on a particular frequency channel it may be necessary to change the frequency channel of the receiver and transmitter.

NOTE: Do not change the receiver address code under any circumstances. Contact Electromotive Systems before making any frequency channel changes.

The PulseStar•609 transmitter and receiver operate over the 400—470 MHz frequency range (70-cm band). There are 16 possible frequencies and 16 corresponding channels available. Figure 2.12: Receiver Frequency Channel Diagram shows each channel, its respective frequency, and the position of the five jumpers according to the diagram for the frequency channel you are setting.

Frequency Channel Considerations

If there are multiple PulseStar radio remote control systems in your facility care should be taken in selecting frequency channels which will operate each system. Although PulseStar systems use a narrow band synthesized carrier frequency, residual or ‘side band’ energy from one system can interfere with other systems if they are in close proximity. Using the following guidelines will ensure that you will have trouble-free operation of all your PulseStar systems:

• Select frequency channels that are as far apart from one another as possible. Example: If you have two PulseStar remote radio controls, use frequency channel 0 and frequency channel 15.
• If PulseStar systems are within 50 feet of one another, each system’s frequency channel should be set a minimum of three channels apart from one another.
• If PulseStar systems are within 200 feet of one another, each system’s frequency channel should be set a minimum of two channels apart from one another.

NOTE: If you are unsure about your application, or are experiencing periodic crane control drop-outs contact Electromotive Systems for assistance.

WARNING

• Do NOT change the address code or frequency channel of the original transmitter that came with your PulseStar•609 system without first contacting Electromotive Systems.
• Do NOT change the address code settings in the PulseStar•609 receiver.
• Do NOT operate two transmitters set with the same frequency channel and address codes as the receiver at the same time.
Setting the Frequency Channel

1. Remove the receiver cover.
2. Reference Figure 2.12: Receiver Frequency Channel Diagram to locate the Frequency Channel Jumper Block inside the receiver.
3. Set the frequency channel jumpers according to Figure 2.12: Receiver Frequency Channel Diagram for the frequency channel you are setting for the receiver. A black box indicates that a jumper should be present in that position. A white box indicates there should be no jumper present in that position.
4. When finished, replace the receiver cover and tighten the four screws.

Figure 2.12: Receiver Frequency Channel Diagram

- 1. Antenna Connector
- 2. TTL Connector
- 3. Standard RF Module
- 4. Frequency Channel Jumper Block
Scan RF Module

The scan RF module is an optional module used in conjunction with Free Channel Search, or when more than one transmitter will be used to control the crane.

AutoScan is where the receiver ‘scans’ for valid frequency channels. Once a valid frequency channel is found, the receiver checks for a valid address code. If the frequency channel does not contain the correct address code, the receiver continues to scan until a valid frequency channel containing the correct address code is found. Once a valid frequency channel containing the correct address code is found, the receiver lock on to that frequency channel and ignores all other signals.

The scan RF module is capable of scanning for up to 16 frequency channels, however the factory setting is for scanning either the odd or even frequency channels. The scan RF module is used with PulseStar•609 systems which have Free Channel Search in the transmitter, or are set up for pitch and catch.

The frequency channel of the transmitter and scan mode setting of the receiver are set by Electromotive Systems prior to shipment. Should interferences occur on a particular frequency channel it may be necessary to change the frequency channel of the transmitter, and the scan mode setting of the scan RF module in the receiver. Contact Electromotive Systems before making any frequency channel changes.

NOTE: Do not change the receiver address code under any circumstances.

WARNING

- Do NOT change the address code or frequency channel of the original transmitter that came with your PulseStar•609 system without first contacting Electromotive Systems.
- Do NOT change the address code settings in the PulseStar•609 receiver.
- Do NOT operate two transmitters set with the same frequency channels and address codes as the receiver at the same time.

The PulseStar•609 transmitter and receiver operate over the 400—470 MHz frequency range (70-cm band). There are 16 possible frequencies and 16 corresponding channels available. Figure 2.13: Scan RF Module shows the scan RF module and location of the configuration jumpers.
Setting the Scan Mode

1. Remove the receiver cover.

2. Set the jumpers to scan for the frequency channel used by the transmitter(s).
   - Solder jumper J1 selects either 8 channel or 16 channel scan. When solder jumper J1 is open, it scans for 8 channels. When closed it scans 16 channels. Factory setting is for 8 channel scan.
   - Jumper J2 is the odd/even channel scan select. When jumper J2 is closed, it scans for odd channels (1, 3, 5, 7, 9, 11, 13, 15). When open it scans for even channels (0, 2, 4, 6, 8, 10, 12, 14).

   **NOTE:** When solder jumper J1 is set for 16 channel scan, jumper J2 is ignored.

3. When finished, replace the receiver cover and tighten the four screws.

Chapter 3

The PulseStar•609 Transmitter
Overview

This chapter tells you how to configure and use the PulseStar•609 transmitter. Several types of transmitters are available for use with the PulseStar•609 system. This manual will cover the basic features of each transmitter, as well as some of the more common options. For a complete description of how your PulseStar•609 system functions contact Electromotive Systems.

Once you’ve installed, wired, and tested the PulseStar•609 system, you are ready to use it. This chapter covers the following information.

- PulseStar•609 Transmitters.
- Transmitter Setup.
- Start-up and Operation.
- Transmitter Options.
- Battery and Charger Information.
PulseStar•609 Transmitters

There are three types of transmitters which can be used with a PulseStar•609 system. They include:

- PBT-4 hand held transmitter
- PBT-5A hand held transmitter
- NVT-J33D belly box transmitter

PBT-4 and PBT-5A Transmitter

The PBT-4 and PBT-5A transmitter is a hand-held radio control device with push-buttons used to control crane motions. Both transmitters can control up to four crane motions with two speed control. The PBT-5A provides independent/combined control of two bridge cranes or two trolley/hoists on a single bridge crane.

The crane motion push-buttons have two detents corresponding to two speeds. The START/HORN, OPTION, and SELECTOR (PBT-5A only) push-buttons are single detent.

PBT-4 and PBT-5A Transmitter Components

The PBT-4 and PBT-5A transmitters have the following components. Refer to Figure 3.14: PBT-5A Transmitter Layout to identify parts of the PBT transmitter.

1. Upper Housing
2. Lower Housing
3. START/HORN Push-button
4. OPTION Push-button
5. Top Bezel and Membrane
6. Power LED
7. Motion Push-button
8. Carrying Belt Fastener
9. Battery
10. Active E-STOP Push-button
11. Key Switch
12. Key Cap
13. SELECTOR Push-button (PBT-5A only)
14. SELECTOR LED (PBT-5A only)

Figure 3.14: PBT-5A Transmitter Layout
PBT-4 and PBT-5A Transmitter Functions

The following describes the basic functionality of the PBT-4 and PBT-5A transmitter. Please reference Figure 3.14: PBT-5A Transmitter Layout for the location of these functions.

**START/HORN Push-button.** The START/HORN push-button activates the mainline contactor and sounds the horn (when provided). Once the mainline contactor has been turned on, pressing this push-button sounds the horn only (when provided).

**Active E-STOP Push-button.** Pressing the Active E-STOP push-button will turn off the mainline contactor. The red Active E-STOP push-button must be pulled out for the transmitter to control the crane motions.

*NOTE:* The Active E-STOP push-button is for emergency situations only. Do NOT use it as an Off switch. Use the key switch to turn the transmitter on and off.

**Power LED.** As soon as the PBT is turned on, this light will flash green. This indicates that the transmitter powered up and has passed a diagnostic check. If the OPTION push-button in the transmitter is set to latching, the power LED will flash red whenever the OPTION push-button is activated.

**Key Switch.** The key switch turns the transmitter on and off. It only works with the key cap inserted, and the key cap can only be removed while in the OFF position.

**Motion Push-buttons.** These push-buttons control the various crane motions and are labeled accordingly.

**OPTION Push-button.** This push-button controls the OPTION function such as Micro-Positioning Control™. A jumper on the PBT circuit board controls whether the OPTION push-button is latching or momentary.

- If the OPTION push-button is set to momentary, the OPTION function is activated only while the operator holds down the push-button. As soon as the push-button is released, the function stops.

- If the OPTION push-button is set to latching, the OPTION function is activated when the push-button is depressed, and the power LED is flashing red. When the push-button is pressed a second time and released, the function stops and the power LED flashes green.

**SELECTOR Push-buttons (PBT5A ONLY).** These push-buttons control the independent or combined control of main and aux hoists, two trolley/hoists, or two cranes. These push-buttons are electronically latched. The SELECTOR function is activated when the push-button is depressed, and the SELECTOR LED is on. When the push-button is pressed a second time and released, the function stops and the SELECTOR LED turns off.

**SELECTOR LED’s (PBT5A ONLY).** These LED’s indicate which SELECTOR push-button is activated.
NVT-J33D Transmitter

The NVT-J33D transmitter has a “belly box” design where the operator maneuvers joysticks to control crane motions. The NVT-J33D transmitter joysticks offer 3 speed control with detents. The NVT-J33D transmitter contains one dual axis joystick and one single axis joystick for up to three motion control.

The NVT-J33D transmitter also offers a SELECTOR toggle switch. With the SELECTOR toggle switch, the NVT-J33D transmitter can control up to five crane motions for independent/combined control.

NVT-J33D Transmitter Components

The NVT-J33D transmitter has the following components. Refer to Figure 3.15: NVT Transmitter Layout to identify parts of the NVT-J33D transmitter.

1. Active E-STOP Push-button
2. OPTION Toggle Switch
3. SELECTOR Toggle Switch
4. START/HORN Push-button
5. Key Switch
6. Key Cap
7. Joystick
8. Lower Housing
9. Carrying Belt Retainer
10. Upper Housing
11. Power LED

Figure 3.15: NVT Transmitter Layout
NVT-J33D Transmitter Functions

The following describes the basic functionality of the NVT-J33D transmitter. Please reference Figure 3.15: NVT Transmitter Layout for the location of these functions.

START/HORN Push-Button. The START/HORN push-button activates the mainline contactor and sounds the horn (when provided). Once the mainline contactor has been turned on, pressing this push-button sounds the horn only (when provided).

Active E-STOP Push-button. Pressing the Active E-STOP push-button will turn off the mainline contactor. The Active E-STOP push-button must be pulled out for the transmitter to control the crane motions.

NOTE: The Active E-STOP push-button is for emergency situations only. Do NOT use it as an Off switch. Use the key switch to turn the transmitter on and off.

Power LED. As soon as the NVT-J33D is turned on, this light will flash green. This indicates that the transmitter is powered up.

Key Switch. The key switch turns the transmitter on and off. It only works with the key cap inserted, and the key cap can only be removed while in the OFF position.

Joysticks. The NVT-J33D transmitter joysticks provide 3 speed control with detents. The NVT-J33D transmitter can control up to three crane motions. This can be increased by using the SELECTOR toggle switch for independent/combined control of cranes or trolley/hoists.

OPTION Toggle Switch. This toggle switch controls the OPTION function such as Micro-Positioning Control™.

SELECTOR Toggle Switch. This toggle switch controls the independent or combined control of main and aux hoists, two trolley hoists, or two cranes. When the SELECTOR toggle switch is set to A, the transmitter controls the crane or motion(s) which are designated as A. When the SELECTOR toggle switch is set to B, the transmitter controls the crane or motion(s) which are designated as B. When the SELECTOR toggle switch is set to A+B, both A and B cranes or motions are controlled by the transmitter.
Transmitter Setup

This section covers how to set up a PulseStar•609 transmitter.

Placing the Push-button Labels

If your new, spare or replacement PBT transmitter came with push-button legends that you need to insert, refer to Figure 3.16: PBT Transmitter Label Insertion and the following instructions. Do not operate the transmitter until all legends are properly installed.

![Figure 3.16: PBT Transmitter Label Insertion](image)

1. Unsnap the push-button cover from the push-button base. Remove the push-button label and replace it with the new label. Place the label in the push-button cover face down so that when you turn the push-button over, the push-button label is visible.

2. Snap the push-button base into the cover. Repeat steps 1 and 2 for each push-button label you are replacing.

3. Assemble the push-buttons on the transmitter according to the layout for your application.

4. Ensure that the transmitter housing is free of dirt, oil and other contaminants or the bezel with membrane covering won’t stick. Use rubbing alcohol to clean any dirt or oils which may be present.

5. Once you are satisfied with the push-button layout, remove the adhesive strip on the back of the bezel with membrane covering and line it up on the enclosure. Press the bezel firmly into place.

**NOTE:** ***DO NOT*** use any glues or adhesives to affix the bezel with membrane covering to the transmitter housing. Doing this can permanently damage the transmitter, and will void the warranty.
Transmitter Address Code and Frequency Channel

This section explains how to set the address code and frequency channel of the PulseStar•609 transmitter. The PulseStar•609 address code and frequency channel are configured at the factory. This should be done ONLY if you are setting up a spare or replacement transmitter, or directed to do so by Electromotive Systems.

• Do NOT change the address code or frequency channel of the original PulseStar•609 transmitter that came with your PulseStar•609 system without first contacting Electromotive Systems.
• Do NOT change the address code settings in the receiver.
• Do NOT operate two transmitters set with the same frequency channel and address code as the receiver at the same time.

Serial Nameplate

The transmitter serial nameplate is located on one of the side walls of the PulseStar•609 transmitter battery cavity. The serial nameplate contains the Electromotive Systems job number, the address code used by the system, and the frequency channel used by the system. The Electromotive Systems job number is important if you ever need to call Electromotive Systems for service. Please have this information available when contacting Electromotive Systems.

![Figure 3.17: Serial Nameplate](image-url)
Setting the Address Code and Frequency Channel of a Transmitter:

Before setting the address code and frequency channel of the transmitter, ensure you first know the address code and frequency channel of the receiver it is going to control. This information can be found by locating the serial nameplate on the PulseStar•609 receiver. Refer to the Serial Nameplate section in chapter 2 for the location of the receiver serial nameplate.

1. Make sure the transmitter is off. Remove the key to be sure.
2. Remove the battery from the transmitter, refer to Battery and Charger Information later in this chapter.
3. Access the inside of the PulseStar•609 transmitter by removing the four screws which hold the upper housing and lower housing together.
4. Locate the two blocks of address code DIP switches on the transmitter coder board, and the frequency channel jumper block on the RF module inside the PulseStar•609 transmitter.

**Determining the Address Code**

Refer to Figure 3.19: PBT Coder Board Layout, or Figure 3.20: NVT Coder Board Layout for typical transmitter coder boards, and the location of the address code dip switches.

The address code is a 16 bit binary number which is assigned to each PulseStar system. This code ensures that no other PulseStar system or other radio controlled device can accidentally operate the crane. The address code number on the serial nameplate is a decimal equivalent to the binary code assigned to the system. To determine the binary code of your PulseStar system you can do one of the following:

- Using a calculator with decimal to binary conversion, enter the decimal address code number from the serial nameplate on the receiver. Then convert this number to it’s binary equivalent.
- Record the 16 address code switch positions inside the receiver. All switches are either ‘on’ or ‘off’. Always read the switches with the numbering and lettering right side up, from left to right, and with switch number one being on the left.
- Consult Electromotive Systems for information concerning your address code.
- Referencing Figure 3.18: Address Switch Chart use the following formula.
1. Write down the transmitter address code.
2. Using the above chart find the largest value that can be subtracted from the address code.
3. Subtract the value from the code.
4. Next to the value write down the corresponding switch number.
5. Repeat steps 1 through 4 until you get a final value of zero.
6. All switches that are listed next to values used should be placed in the on position. All switches that are not listed are to be placed in the off position.

**EXAMPLE:**

The address code is 32518.

\[
\begin{array}{r}
32518 \\
-16384 \quad \text{Switch 2.7 On} \\
16134 \\
-8192 \quad \text{Switch 2.6 On} \\
7942 \\
-4096 \quad \text{Switch 2.5 On} \\
3846 \\
-2048 \quad \text{Switch 2.4 On} \\
1798 \\
-1024 \quad \text{Switch 2.3 On} \\
774
\end{array}
\]

Once you have the correct address code information you can configure the transmitter to work with the existing receiver.
Setting the Address Code

Reference Figure 3.19: PBT Coder Board Layout for changing the address for a PBT-4 or PBT-5A transmitter, or Figure 3.20: NVT Coder Board Layout for changing the address for a NVT-J33D transmitter.

**WARNING**

- Do NOT change the address code or frequency channel of the original PulseStar•609 transmitter that came with your PulseStar•609 system without first contacting Electromotive Systems.
- Do NOT change the address code settings in the receiver.
- Do NOT operate two transmitters set with the same frequency channel and address code as the receiver at the same time.

1. Position the address code switches so that the numbering and lettering is right side up.
2. Locate switch 1.1 on the left most block of the address code switches. This switch is the first bit of the binary address code.
3. Set each switch to either ‘on’ or ‘off’ according the binary address code information.
4. If you do not have to set the frequency channel you can now close the transmitter by mating the lower and upper halves and inserting the four screws for the PBT-4, PBT-5A, or NVT-J33D transmitter.

Figure 3.20: NVT Coder Board Layout
Setting the Frequency Channel

The frequency channel of the transmitter must be set to the frequency channel of the receiver it is going to control. The transmitter and receiver operate over the 400–470 MHz frequency range (70-cm band). There are 16 possible frequency channels. Figure 3.21: Frequency Diagram shows the transmitter RF Module, and each channel, its respective frequency, and the position of the five jumpers.

1. Locate the RF Module inside the transmitter.
2. Locate the Frequency Channel Jumper Block on the RF Module. Position the transmitter so that the A1 jumper position is on your left-hand side.
3. Set the frequency jumpers according to the diagram for the desired frequency. A black box indicates that a jumper should be present in that position. A white box indicates there should be no jumper present in that position.
4. When finished, close the transmitter by mating the lower and upper halves and inserting the four screws for the PBT-4, PBT-5A, or NVT-J33D transmitter.

Start-up and Operation

Holding the Transmitter

Before using the PulseStar•609 transmitter, refer to the following information on how to hold the PulseStar•609 transmitter the correct way.

WARNING

To make sure that you are oriented correctly in relation to the directional push-buttons or joysticks. Hold the transmitter as shown.

PBT-4 and PBT-5A Transmitter

Please refer to Figure 3.22: PBT Transmitter Orientation on how to properly hold the PBT-4 or PBT-5A transmitter.

Figure 3.22: PBT Transmitter Orientation
NVT-J33D Transmitter

Please refer to Figure 3.23: NVT Transmitter Orientation on how to properly hold the NVT-J33D transmitter.

Figure 3.23: NVT Transmitter Orientation
Start-up

Refer to the appropriate transmitter layout figure shown in the PulseStar•609 Transmitters section for the location of the various functions on the PulseStar•609 transmitter. To start the PulseStar•609 transmitter:

1. Make sure that there is a charged battery in the transmitter.
2. Make sure the Active E-STOP push-button is pressed in (activated).
3. Make sure no motion push-buttons are depressed (PBT) or all joysticks are in the center (off) position (NVT transmitters).
4. Insert the key into the key switch and turn to the ON position. The power LED flashes to indicate power is on. The transmitter will emit a sound indicating that the transmitter is going through a diagnostic check.
5. Pull out the Active E-STOP push-button and press the START/HORN push-button to provide power to the mainline contactor.

The transmitter is now ready for use.

Emergency Stop

For all emergency situations, push in the Active E-STOP push-button. To restart, pull out the Active E-STOP push-button and press the START/HORN push-button.

When the PulseStar•609 battery voltage drops below approximately 8 volts, a buzzer will sound inside the transmitter. At the end of the 30 second period, the transmitter will automatically shut itself off and places the receiver in Safe Mode. This blocks all crane motion commands.

Using the Motion Push-buttons (PBT-4 and PBT-5A)

The PBT-4 and PBT-5A transmitter can control up to four crane motions. Each pair of push-buttons corresponds to one crane motion. The push-buttons are “interlocked,” which means that only one push-button in each horizontal row is operational at a time. In other words, if you press a push-button, the crane function corresponding to that push-button will be activated. If you then press the other push-button in the same row while still holding down the first push-button pressed, the receiver will ignore the crane motion corresponding to the second push-button pressed.

Using the Joysticks (NVT-J33D)

The NVT-J33D transmitter come equipped with one single axis and one dual axis joystick. All joysticks have a spring return to the center (off) position. Locate the transmitter label which corresponds to the joystick function you wish to operate. Deflect the joystick in the direction you want the crane motion to move according to the label. If the crane motion is more than one speed, the further you deflect the joystick from it’s center position, the faster the crane motion will move. To stop the crane motion(s) simply return the joystick to the center (off) position.

Using the Option Toggle Switch or Push-button

The PulseStar•609 transmitter is provided with an OPTION toggle switch (NVT-J33D) or push-button (PBT-4, PBT-5A). Turn the OPTION toggle switch on, or press the OPTION push-button to activate the device, if any, which is connected to the OPTION relay inside the PulseStar•609 receiver.
Using the SELECTOR Toggle Switch or Push-buttons

The PulseStar•609 transmitter is provided with a SELECTOR toggle switch (NVT-J33D) or push-buttons (PBT-4, PBT-5A) which control the independent or combined control of main and aux hoists, two trolley hoists, or two cranes. When the SELECTOR toggle switch or push-button is set to A, the transmitter controls the crane or motion(s) which are designated as A. When the SELECTOR toggle switch or push-button is set to B, the transmitter controls the crane or motion(s) which are designated as B. When the SELECTOR toggle switch or push-buttons is set to A+B, both A and B cranes or motions are controlled by the transmitter.

Shutting Off the Transmitter

When you are finished using the transmitter, turn the key switch to OFF. The mainline contactor will drop out. Remove the key switch and take it with you to prevent unintended use.
Transmitter Options

The following are some of the more common options which are available with the PulseStar•609 system pertaining to the PulseStar•609 transmitter. If you have any questions about the functionality of your PulseStar•609 system contact Electromotive Systems.

Spare Transmitter

Spare transmitters can be used in the event that the primary transmitter becomes lost or damaged. One transmitter is used as the main crane control and the other is designated as a spare. Only one transmitter is active at any given time.

NOTE: If both transmitters are set to the same frequency and address, and both transmitters are turned on, the receiver will go into Safe Mode.

Crane Control Using Multiple Transmitters

Several crane applications require the use of more than one transmitter, or a transmitter may be required to control two cranes simultaneously.

Pitch and Catch

Pitch and catch is where multiple (typically two) transmitters control the same receiver, but not at the same time. This is ideal for applications with long crane bays where control of the crane will be handed off to another operator, or where restricted visibility makes it necessary for more than one operator to position the load.

• All transmitters must be configured with the same address code as the receiver
• Each transmitter must be set to a different frequency channel.
• The receiver must be configured for AutoScan.

The first transmitter to be turned on will control the crane. An operator moves the load with this transmitter to a specific location and then switches the transmitter off. A second operator switches their transmitter on and presses the START/HORN push-button. The second operator then takes over control of the crane the rest of the way. If a transmitter is turned on while the other transmitter is controlling the crane, the receiver ignores the signal from the transmitter which was turned on last.

Free Channel Search

All PulseStar•609 transmitters can be provided with Free Channel Search. Free Channel Search is a module located inside the transmitter which works with the RF module to find a frequency channel which is suitable for broadcasting. Free Channel Search is ideal for environments which have a large amount of RF interference caused by equipment broadcasting in the same frequency range as the PulseStar•609 system.

When the transmitter is turned on, the Free Channel Search module begins to scan the environment for interference. The Free Channel Search module can be configured to scan all 16 frequency channels, or just the odd or even frequency channels. Scanning all 16 frequency channels takes approximately 3 seconds. The PulseStar•610 receiver must be configured for AutoScan to use Free Channel Search.
When activated the Free Channel Search module starts at frequency channel 0 (even or sixteen frequency channel mode) or frequency channel 1 (odd frequency channel mode) and determines if that frequency channel is clear for communicating with the receiver.

If the frequency channel is clear for communications, the transmitter locks on to that frequency channel, and begins transmitting information to the receiver. If there is interference on that frequency channel, the Free Channel Search module goes to the next frequency channel until it finds a clear channel.

If interference begins to affect crane operation, simply cycle transmitter power (turn off and back on again). Free Channel Search finds another frequency channel to broadcast on which is free from interference.

**NOTE:** Not all applications are appropriate for Free Channel Search. Consult Electromotive Systems and discuss your application prior to using Free Channel Search.

### Setting the Odd/Even Channel Search of the Free Channel Search Function

If you ordered your PulseStar•609 system with the Free Channel Search feature, the transmitter automatically begins broadcasting on the first available clear channel when turned on. You can control which frequency channels the transmitter searches through (odd or even) to find the cleanest frequency channel by setting jumper J2 odd/even scan select on the Free Channel Search module.

**NOTE:** The Free Channel Search module is set at the factory to work with the scan RF module in the receiver. If changes are made to the Free Channel Search module, the same changes must be made to the scan RF module in the receiver.

Use Figure 3.24: Free Channel Search Module to locate the jumpers on the Free Channel Search module.

1. Test Connector
2. Frequency Channel Jumper Block Connector
3. Free Channel Search Module
4. J1 8/16 scan select
5. J2 Odd/Even Scan Select
6. Sensitivity Potentiometer

**Figure 3.24: Free Channel Search Module**

1. Make sure the transmitter is off. Remove the key to be sure.
2. Remove the battery from the transmitter, refer to Battery and Charger Information later in this section.
3. Access the inside of the PulseStar•609 transmitter by removing the four screws which hold the upper housing and lower housing together.
4. Remove the **Free Channel Search** module from the RF module.
   - Remove the screw which holds the **Free Channel Search** module to the stand-off.
   - Unplug the **Free Channel Search** module from the RF Module Frequency Channel Jumper Block.

5. Access the back side of the **Free Channel Search** module and locate the configuration jumpers.

6. Set the jumpers to scan for the frequency channels used by the receiver.
   - Solder jumper J1 selects either 8 channel or 16 channel scan. When solder jumper J1 is open, it scans for 8 channels. When closed it scans 16 channels. Factory setting is for 8 channel scan.
   - Jumper J2 is the odd/even channel scan select. When jumper J2 is closed, it scans for odd channels (1, 3, 5, 7, 9, 11, 13, 15). When open it scans for even channels (0, 2, 4, 6, 8, 10, 12, 14).

   **NOTE:** When solder jumper J1 is set for 16 channel scan, jumper J2 is ignored.

7. When finished, attach the **Free Channel Search** module to the RF module, replace the screw holding the **Free Channel Search** module to the stand-off, and close the transmitter by mating the lower and upper halves and inserting the four screws.
Battery and Charger Information

Removing and Inserting the Battery From the Transmitter

PBT-4 and PBT-5A Transmitter

To remove or insert the battery from the PBT-4 and PBT-5A transmitter, refer to Figure 3.25: PBT Transmitter Battery Removal.

**Removal:** Push the battery tab toward the battery. Pivot the battery away from the housing until the battery pops out of the compartment.

**Insertion:** Locate the two battery hinges on the battery. They are opposite the battery tab. Line up the battery hinges with the corresponding hinge guides in the battery cavity wall of the transmitter. Place the battery, hinge side first, into the battery cavity and slide the battery hinges into the hinge guides. Slowly press downward on the battery until the battery tab locks into place.

![Figure 3.25: PBT Transmitter Battery Removal](image-url)
NVT-J33D Transmitter

To remove or insert the battery from the NVT-J33D transmitter, refer to Figure 3.26: NVT Transmitter Battery Removal.

**Removal:** Push the battery toward the spring-loaded contacts. Tilt the battery away from the housing until the battery pops out of the compartment.

**Insertion:** Place the battery in the battery cavity at an angle, with the end containing the gold plated contacts facing the spring-loaded contacts. Push battery into the battery cavity and against the spring loaded contacts until the battery can be placed flush against the battery cavity wall. The battery should now be securely positioned inside the battery cavity.

*Figure 3.26: NVT Transmitter Battery Removal*
Charging the Battery

The PulseStar battery charger is designed for 115/230VAC and plugs into a regular wall outlet. Please refer to Figure 3.27: Battery Charger for NVT Transmitters and Figure 3.28: Battery Charger for PBT Transmitters for charger layout.

1. Discharge Push-button (Discharge version only)

10. Charge LED

Figure 3.28: Battery Charger for PBT Transmitters
Standard Charger

Insert the battery into the charger. The green charge LED emits a steady light to indicate that the battery is being charged.

The processor in the charger checks the capacity of the battery until the battery is fully charged. The maximum charging time is four hours. When the battery is fully charged, the green charge LED begins to flash. Leave the battery in the charger until needed to ensure it is fully-charged.

If the power supply to the charger is interrupted, or the battery is removed and then reinserted into the charger (before the battery was fully charged), the charger detects how much charge the battery has left and resumes the charging process.

Discharge Charger

Insert the battery into the charger. The green charge LED emits a steady light to indicate that the battery is being charged. Press the red Start Discharge push-button. The green charge LED turns off, and the red discharge LED turns on. The battery will now fully discharge. Once the battery is fully discharged, the red discharge LED will turn off, and the green charge LED will turn on. The green charge LED emits a steady light to indicate that the battery is being charged.

The processor in the charger checks the capacity of the battery until the battery is fully charged. The maximum charging time is four hours. When the battery is fully charged, the green LED begins to flash. Leave the battery in the charger until needed to ensure it is fully-charged.

The following table summarizes battery information for the NVT-J33D transmitter.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Charging Time</td>
<td>4 hours (from fully discharged)</td>
</tr>
<tr>
<td>Operation Time</td>
<td>7–10 hours continuous</td>
</tr>
<tr>
<td>Type</td>
<td>Nickel Metal Hydrite; 9.6 Volts, 750 milliampere hours</td>
</tr>
<tr>
<td>Maximum number of charges</td>
<td>Approximately 800 times</td>
</tr>
</tbody>
</table>

The following table summarizes battery information for PBT-4 and PBT-5A transmitters.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>

</thead>
<tbody>
<tr>
<td>Charging Time</td>
<td>4 hours (from fully discharged)</td>
</tr>
<tr>
<td>Operation Time</td>
<td>7–10 hours continuous</td>
</tr>
<tr>
<td>Type</td>
<td>Nickel Cadmium; 9.6 Volts, 600 milliampere hours</td>
</tr>
<tr>
<td>Maximum number of charges</td>
<td>Approximately 800 times</td>
</tr>
</tbody>
</table>

**NOTE:** A long life Nickel Cadmium battery is available for the PBT-4 and PBT-5A transmitters. Operation time is 12-14 hours, and the capacity is 1000mAH.

All charger and battery contacts are gold-plated to provide superior contact. Batteries and chargers are IP65-rated. The mechanical design of the battery case and the battery pocket ensures that each insertion and removal of the battery will clean the contacts. This is known as “self-cleaning” contacts.

Memory Effect

To maximize the lifetime of your battery, **only charge completely discharged batteries** whenever possible. Charging a partially discharged battery may result in a memory effect in the battery, which reduces the number of times it can be effectively charged.
chapter 4

Troubleshooting
PulseStar•609
Troubleshooting

Introduction

This chapter covers what to do if the PulseStar•609 does not seem to work properly. If you are unable to resolve the problem after using this section, contact Electromotive Systems immediately at 1-800-288-8178.

WARNING

- Only authorized personnel are permitted to perform the initial setup or service work. Use only Electromotive Systems parts.
- Do NOT touch any circuit components on the circuit board while the main AC power is on.
- Do NOT change the address code settings in the receiver.

Common Problems

The following are common problems associated with using the PulseStar•609 system, and their possible solutions. For help in diagnosing problems in the receiver, refer to the drawing in the Start-up and Test Procedures section in chapter 2 that shows the location of each diagnostic LED.

Problem: The transmitter is turned on, but it does not broadcast (Power LED not flashing).

Possible Solution(s):
- Battery is dead. Replace with fully charged battery.
- Fuse located on coder board is blown. Check fuse and replace if blown.
- Key switch is broken. Check wiring to the key switch contact element. Replace key switch wiring or contact element.
- The coder board has failed. Contact Electromotive Systems.

Problem: The transmitter is broadcasting, but all crane motions are not working.

Possible Solution(s):
- The Active E-STOP push-button is activated (pushed in). Pull out the Active E-STOP push-button and press the START/HORN push-button.
- Transmitter is out of range (328 feet typical). Bring the transmitter back into range, and press the START/HORN push-button.
- A crane motion function was not ‘off’ when transmitter was turned on. Make sure all joysticks (NVT-J33D) and push-buttons (PBT-4, PBT-5A) are in the center (off) position. Cycle transmitter power (turn off and then on) and press the START/HORN push-button.
- Incoming power to receiver is off. Turn on power to receiver.
- Fuse is blown in receiver. Check all line fuses and Power Pack fuses. Replace any blown fuses.
• Receiver is set for different frequency channel. If green Telegram LED located on the decoder board is not flashing, check that the receiver frequency channel matches that of the transmitter.

**NOTE:** *Always match the transmitter frequency channel to the receiver. Never change the receiver frequency channel without consulting Electromotive Systems first.*

• Receiver is set for different address code. Check to make sure the address code on the decoder board matches the address code of the transmitter.

**NOTE:** *Always match the transmitter address code to the receiver. Never change the receiver address code without consulting Electromotive Systems first.*

• **Active E-STOP** failure in transmitter. Check **Active E-STOP** push-button for damage. Check wiring to **Active E-STOP** push-button contact element for broken or disconnected wire(s). Replace broken wire(s) or **Active E-STOP** push-button.

• **Active E-STOP** failure in the receiver. Check **Active E-STOP** LED on decoder board. If it is illuminated:
  • Wire may have come disconnected from the **Active E-STOP** module. Check for loose wiring.
  • **Active E-STOP** module has failed. Replace the **Active E-STOP** module.

**Problem:** All crane motions work intermittently.

**Possible Solution(s):**

• Antenna on receiver is loose or has fallen off. Tighten or replace antenna.

• External antenna (when used) is loose, poorly grounded, or receiving interference. See Connecting a Standard External Antenna section in chapter 2.

• Surge suppressors are not installed on contactors being controlled by the receiver. Insure that all contactors being controlled by the receiver have surge suppressors installed.

• Control wiring may be combined with power wiring. Make sure that all control wiring is separate from power wires.

• Connector inside receiver has come loose. Check all Dubox (blue) connectors.

• Another PulseStar transmitter may be interfering with the system. If another PulseStar system is located within 200 feet, the frequency channels must be at least 2 channels apart. If another PulseStar system is within 50 feet, the channels must be at least 3 channels apart. Contact Electromotive Systems for assistance.

**Problem:** Some crane motions work intermittently.

**Possible Solution(s):**

• Wiring may be loose to that crane motion. Check wiring from the receiver to the quick disconnect plug, and check wiring from quick disconnect plug to crane motion.

• Connector inside receiver has come loose. Check all Dubox (blue) connectors.

• Surge suppressors may not be installed on contactors controlling that crane motion. Insure that all contactors being controlled by the receiver have surge suppressors installed.

• Control wiring may be combined with power wiring. Make sure that all control wiring is separate from power wires.
Questions to Ask

When reporting a problem to Electromotive Systems you may be asked several questions pertaining to the PulseStar•609 system. Asking these questions to the person who reported the problem prior to calling Electromotive Systems will speed up the troubleshooting process.

Transmitter

• Is the Active E-STOP push-button pulled out?
• Is the key switch in the ON position?
• Did you press the START/HORN push-button?
• Are the joysticks, switches, and push-buttons in the center (off) position?
• Did you press the START/HORN push-button while accidently holding in one of the other push-buttons?
• Is there a charged battery installed?
• Did you take the transmitter out of its operating range (328 feet)?

Receiver

Open the cabinet enclosure where the receiver circuit board is installed and check the following. Refer to the drawing in the Start-up and Test Procedures section in chapter 2 that shows the location of each diagnostic LED.

• Is the CPU Standby LED flashing?
• Is the Telegram LED flashing?
• Is the Active E-STOP LED lit on the decoder module?
• Are the connections/screw terminals tight?
• Is the internal antenna securely connected?
• Is the external antenna assembly outside the enclosure securely connected?
• Are all incoming power supply and ground wires properly connected?
• Are the signal wires separated from the power wires?
• Are surge suppressors installed on all magnetic contactors being controlled by the receiver?

# Definitions and Abbreviations

## Definitions

The following terms are used throughout the *PulseStar•609 Instruction Manual* and may be unfamiliar to some operators.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>analog</td>
<td>Proportional-stepless or infinite control</td>
</tr>
<tr>
<td>baud</td>
<td>The transmitting speed measured in bits per second</td>
</tr>
<tr>
<td>decoder</td>
<td>Converts a serial data message into parallel signals</td>
</tr>
<tr>
<td>double superheterodyne</td>
<td>A method to build an extremely narrow band receiver by converting the receiver frequency twice.</td>
</tr>
<tr>
<td>coder</td>
<td>Converts parallel signals into a serial data message</td>
</tr>
<tr>
<td>hamming distance</td>
<td>A measurement of data transmission safety. The amount of failures in the data stream which has to occur during the transmission in order to create a wrong signal. A low hamming distance means that the test is not very sensitive to data transmission errors and could be potentially unsafe. A high hamming distance means that the system is very sensitive and could potentially be unreliable due to potential noise interference.</td>
</tr>
<tr>
<td>latching</td>
<td>The auxiliary function will turn on when the operator presses option button once and releases it (PBT) or flips the spring return switch up (NVT). The auxiliary function will not turn off until the operator presses the option button a second time (PBT) or flips the spring return switch (NVT).</td>
</tr>
<tr>
<td>maintained</td>
<td>The auxiliary function will turn on when the operator flips the maintained switch to the appropriate position (NVT). The auxiliary function will turn off as soon as the operator flips the maintained switch to the off position (NVT).</td>
</tr>
<tr>
<td>momentary</td>
<td>The auxiliary function will turn on when the operator presses the option button and holds it down (PBT) or flips the spring-return switch and holds it up (NVT). The auxiliary function will turn off as soon as the operator releases the option button (PBT) or releases the spring-return switch (NVT).</td>
</tr>
<tr>
<td>synthesizer technology</td>
<td>Used to electronically generate a carrier frequency.</td>
</tr>

StarService and Warranty
StarService Policy

This chapter includes information pertaining to on-call service, transmitter loaner and Repair program, and Receiver Replacement/Repair Program warranty. Before you install, troubleshoot, or service the radio control system, we highly recommend that you read this entire chapter. Doing this will help assure quick service response, minimize your on-site repair costs, and reduce crane downtime.

On-Call Service

If you ever have a problem with your PulseStar•609 system, call Electromotive Systems at 1-800-288-8178. Technical support is available 24 hours a day, seven days a week. If necessary, Electromotive Systems can arrange to have a service technician visit your site to evaluate the situation (normally at your expense.)

Warranty

Every PulseStar product includes a two-year warranty from the date of shipment. The warranty is described in detail later in this chapter.

Transmitter Loaner, Replacement & Repair Program

The PulseStar Transmitter Loaner, Replacement & Repair Program provides a replacement transmitter, or loaner transmitter while your transmitter is being repaired. Under the terms of the Loaner, Replacement and Repair Program, please provide a purchase order or credit card to cover the cost of the loaner transmitter.

If you need to return a defective transmitter, please follow the steps below.

1. Request a Return Authorization (RA) from Electromotive Systems’ Service Department and return the defective transmitter to Electromotive Systems via pre-paid freight. When you call, please have the information from the serial nameplate of the transmitter available.

2. Electromotive Systems will ship a loaner or replacement transmitter within 24 business hours.

3. Electromotive Systems will inspect the defective transmitter and determine if the defects are covered under warranty. If the defects are covered under warranty, Electromotive Systems, at their discretion, will do one of the following:
   • Replace the defective transmitter with the loaner or equivalent transmitter. The replacement transmitter will be covered for the duration of the original transmitter warranty period.
   • Credit the full cost of the loaner transmitter, plus pay for all freight charges for both the loaner transmitter and the transmitter repaired under warranty.

   NOTE: Freight charges incurred from sources other than common ground carriers WILL NOT be reimbursed unless pre-approved by Electromotive Systems.

   • If the defects are not covered under warranty, Electromotive Systems will credit the cost of the loaner transmitter, less the cost of the repairs, a $50 loaner inspection fee, and any freight charges incurred by Electromotive Systems.

4. Electromotive Systems will repair or replace the transmitter. Repaired transmitters will be shipped from Electromotive Systems within 72 business hours of receipt of transmitter (three working days).
5. If the original transmitter is repaired, return the loaner transmitter in good condition to Electromotive Systems via prepaid freight.

Receiver Repair Program

The process for returning a defective PulseStar•609 receiver is described in the following steps.

1. Request a Return Authorization (RA) from Electromotive Systems’ Service Department and return the defective receiver to Electromotive Systems via prepaid freight. You are responsible for the shipping charges for sending the defective parts to Electromotive Systems.

2. Electromotive Systems will inspect the receiver and determine if the defects are covered under warranty.
   - If the defects are covered under warranty, Electromotive Systems will repair the receiver at no cost, and credit the full cost of all freight charges.
     
     NOTE: Freight charges incurred from sources other than common ground carriers WILL NOT be reimbursed unless pre-approved by Electromotive Systems.

   - If the defects are not covered under warranty, you are responsible for the cost of the repairs and all freight charges.
Limited Warranty And Terms Of Sale

Prices: Subject to Change Without Notice  
Terms: Net 30 Days

Electromotive Systems, hereafter referred to as Company, guarantees all items manufactured by it against any defects of material and/or workmanship for a period of two years from the date of shipment. Company makes NO OTHER WARRANTY, EXPRESSED OR IMPLIED, AS TO THE MERCHANTABILITY OR FITNESS OF THE ITEMS FOR THEIR INTENDED USE OR AS TO THEIR PERFORMANCE. Any statement, description or specification in Company’s literature is for the sole purpose of identification of items sold by the Company and imparts no guarantee, warranty or undertaking by company of any kind. Components and accessories not manufactured by Electromotive Systems are not included in this warranty and are warranted separately by their respective manufacturers.

Company’s sole liability shall be to repair at its factory, or replace any item returned to it within two years from date of shipment, which Company finds to contain defective material or workmanship. All items to be repaired or replaced shall be shipped to Company (Note: return authorization by Company is required) within said two year period, freight prepaid, as a condition to repair or replace defective material or workmanship. Company’s herein assumed responsibility does not cover defects resulting from improper installation, maintenance, or improper use. Any corrective maintenance performed by anyone other than the Company during the warranty period shall void the warranty. Company shall not be liable for damages of any kind from any cause whatsoever beyond the price of the defective Company supplied items involved. Company shall not be liable for economic loss, property damage, or other consequential damages or physical injury sustained by the purchaser or by any third party as a result of the use of any Company supplied items or material.

Company neither assumes nor authorizes any other person to assume for Company any other liability in connection with the sale or use of items sold by Company.

List prices or discounts are subject to change without notice. Quoted prices will be honored for a period of 30 days from the date of the written quotation unless otherwise stated.

Orders of $25,000 or more, and orders for special control panels are subject to special terms and conditions of sale. Refer to those specific sections within this document.

Orders are not subject to alteration or cancellation except upon written consent of Company and payment of proper cancellation charges, when deemed applicable by Company.

Materials or items may not be returned for credit, without the prior written consent of the Company. Any authorized return of materials or items shall be subject to a restocking charge equal to 20% of the net invoiced amount after Company determines that the material or item is in good condition and may be resold without alteration or service. If upon receipt of the material or items returned, the Company determines that said materials or items cannot be resold without alteration or service, the Company reserves the right to reject the returned materials or items and to send the same back to said purchaser at purchaser’s expense.

Terms of payment are NET 30 days. All materials and items are sold F.O.B. Company’s shipping point. Company retains a security interest in all items sold by it so long as they remain in Company’s possession to secure all obligations of purchaser to Company. A processing fee will be applied to all invoices for requested prepaid freight charges other than UPS. A service charge will be incurred on past due accounts extending beyond the Terms of Sale described above, at a rate of 1.5 per month or a fraction thereof, of the net balance extending beyond 30 days.
Any claim for errors in shipment or for material or item shortages must be received by Company within 30 days of shipment and must be accompanied by copies of the bill of lading and packing slip.

**Special Terms and Conditions: Orders of $25,000 or More**

**Electrification and Control Orders**

**Drawings and Drawing Approvals (if applicable)**

In most cases, Electromotive Systems will submit drawings for customer approval within 30 days after receipt of purchase order.

Customer drawing approval and Electromotive Systems credit approval is required before Electromotive Systems will proceed with parts procurement or assembly work.

**Progress payment**

25% of total order is required prior to shipment.

75% balance to be paid Net 30 days upon shipment of order.

**Customer Requested Changes**

Customer shall pay for any additional charges that may be incurred due to customer change orders as incurred.

**Cancellation Policy**

Cancellation fee of 10% of orders, plus all charges that may to incurred to-date of cancellation, will be applicable to all orders cancelled after receipt of order.

**Credit Approval**

All orders are subject credit approval by Electromotive Systems

All items manufactured and offered for sale by Electromotive Systems are subject to limited warranty and terms of sale. These special terms and conditions are part of the limited warranty and terms, and only supersede to take exception to said warranty and terms section of this document for a complete description.

**Special Terms and Conditions: Orders for Special Control Panels**

**Drawing and Drawing Approvals**

In most cases, Electromotive Systems will submit drawings for customer approval within 30 days after receipt of purchase order.

Customer drawing approval and Electromotive Systems credit approval is required before Electromotive Systems will proceed with parts procurement or assembly work.

**Progress payments**

25% of total net order is required upon drawing approval.

25% of total net order is required prior to shipment.

50% balance to be paid Net 30 days upon shipment of order.

**Customer Requested Changes**
