Heavy Duty C-Track Festoon Systems

Instruction Manual
DANGER, WARNING, CAUTION, and NOTE Statements

DANGER, WARNING, CAUTION, and Note statements are used throughout this manual to emphasize important and critical information. You must read these statements to help ensure safety and to prevent product damage. The statements are defined below.

DANGER

DANGER indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury. This signal word is to be limited to the most extreme situations.

WARNING

WARNING indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION

CAUTION indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury. It may also be used to alert against unsafe practices.

NOTE: A NOTE statement is used to notify people of installation, operation, programming, or maintenance information that is important, but not hazard-related.
Heavy Duty C-Track Festoon System Installation Instructions

General Considerations

1. Determine the length of the span to be festooned. Consideration should be given to the impact of the storage distance (stack up) on the actual travel distance of the moving equipment, and the speed at which the system will run.
   a. To determine storage/stack up area, multiply length of trolley by the number of trolleys. (i.e. 5" long trolley x 10 trolleys = 50”).
   b. To determine the length of track required, add the sum of the storage distance, the working travel, and ½ the length of the lead trolley. Consider that C-track sections are available in either 10 or 20 foot standard lengths, or can be supplied in cut-lengths of whole foot increments.
   c. For systems with speeds of 250 feet per minute or more, consult the factory, as tow cables/chain may be required.

2. Determine the desired loop depth. A 3-foot loop depth is common. A deeper loop depth requires fewer trolleys and reduces the storage (stack up) distance.

3. Select the proper Flat Cable which meets or exceeds the electrical requirements of the application, based upon the amperage and conductors required. The total number of control wires should include one common and one ground. Additional wires may be required for brakes, limit switches or other devices when controls are mounted remotely from their motors.
   a. The length of cable required is the sum of the length of track, plus approximately 20% for cable sag, plus the distance to the power source.
   b. Calculate total weight of cable per trolley to ensure that a maximum of 150 lbs. per trolley is not exceeded – cable specifications are on page 5. Cables may be stacked in the saddle so long as the maximum weight per trolley is not exceeded.
   c. To calculate cable load/trolley use: load depth (ft.) x 2 x cable wt./lf. (reference page 5 for cable engineering data).

4. Determine the track support/hanger spacing. Recommended hanger spacing is 5ft. centers. For systems with cable loads exceeding 150 lbs. Please consult factory.
   a. It may be necessary to add another hanger in the storage/stack up area due to additional weight when trolleys accumulate there and heavier gauge cables are used.

5. Determine the number of trolleys required by dividing the length of the run by the total amount of cable required for one loop. (i.e. a 3-foot loop depth requires 6 feet of cable). The number of intermediate trolleys will be reduced by one (1) to account for the lead/tow trolley or control box trolley.

6. Determine the junction box size and terminal strips required for the amount of conductors being festooned from the power source and/or the control box trolley. Cable grips are available for terminating cable in various sizes and for multiple cable accommodations.

*Additional Components:

Pendant pushbutton stations and round pendant cable available in standard and custom configurations–consult factory

Components for multiple saddle and/or round cable also available–consult factory

*For your reference, technical bulletins for most components may be requested by calling the factory or are available online at www.magnetekmh.com under “Document Center” in the Festoon section of the “Application Bulletins” page.
Installation Procedures (refer to drawing–figure 1 on page 3)

1. Install Cross Arm Support Brackets—either weld or bolt sections of C-Track to beam or angles, channels, etc., sufficient to carry 150 lbs. each.

2. Install Track Hangers on Cross Arms with fasteners furnished. Leave the clamping bolts loose so C-Track can be inserted.

3. Install C-Track into Hanger Clamps, butting ends of C-track together. Tighten Hanger Clamps securely.

4. Join C-track sections together with Track Joint assemblies. Tighten the clamping allen screws securely.

5. Insert the Lead/Tow Trolley or Control Box Trolley and Intermediate Cable Trolleys into the C-Track, making sure all trolleys roll freely.

6. Install the End Cable Clamp assembly in the C-Track at the cable storage end. Tighten Securely.

7. Install the End Stop in the C-Track opposite the storage end.

8. Loosen the wing nuts (but do not remove wing nuts) on the trolley saddles. Feed the festoon cables into the trolleys between the clamping pad and saddle. Make sure to leave enough cable past the Tow/Lead Trolley or Control Box Trolley to wire into the enclosure. Measure the desired loop depth and tighten the wing nuts to secure the festoon cables.

9. Install festoon cable grips into approved junction boxes and insert cables through the cable glands. Tighten cable grip nuts firmly to secure cables.

10. For power & control applications, install the Tow Arm in the center of the rectangular box mounted on the Tow/Lead Trolley. The Tow Arm should be securely fastened to the moving equipment to be electrified.

11. For traveling pendant pushbutton applications, install the junction box on the Control Box Trolley. Fasten securely with hardware furnished.

12. Run the completed festoon system back and forth several times over the entire system to ensure proper operation. Flat festoon cables should extend and retract in a straight line if the cables have been properly fastened to the trolleys.
Flat Festoon Cables and Trolleys—Engineering Data

**Trolley Specifications**
- Trolleys provided with ball bearing wheels
- Trolleys capable of supporting up to 150 lbs. each
- Consult factory for speeds 250 feet per minute or higher

**Cable Saddle Specifications**
- 5” long Trolleys have 3” diameter nylon cable saddle with 1” x 2¼” maximum cable opening
- Multiple saddle configurations to accommodate flat or round cable available—consult factory

**Flat Festoon Cable Reference—Cable Specifications**
- Indoor/Outdoor Festoon flat cable and round pendant control cable
- 105°C (221°F) 600 volt AC, 250 volt DC
- Conductors are annealed copper
- Each conductor has color coded jacket
- Jacket rating -40°C (-40°F) to 105°C (221°F)
- Resistant to UV, ozone, water, oil and weather
- 4, 8, or 12 conductor flat cable
- #2 AWG through #16 AWG flat cable

*—Ampacities are de-rated at higher temperatures (above 30°C).
*Minimum Bending Radius (approx. 4 X cable thickness)*
*Specialty cable also available—contact the factory for more information*
*Cable available in specific lengths or in Full Reels of 500 or 1000 feet*
*Round pendant cable available in #16 AWG with 8, 12, 16, 24 or 36 conductors*
*Not suitable for 3” Diameter Trolley Saddles*
